

## 一、硬件相关:

1. PHY芯片用的RTL8021F rmii方式连接 (这个需要查看硬件电路图, 确认是用的rmii还是mii的连线方式)
2. 一般默认的PHY地址都是1, 大部分不需要修改;

## 二、软件相关

### 2.1 Uboot相关 (hisi 3519sdk uboot修改项目)

1. 修改默认的rgmii 为rmii, 大概下面的命令找到对应文件修改久可以了~~

```
/u-boot-2010.06$ grep "CONFIG_HIGMAC_PHY1_INTERFACE_MODE" * -rn
```

```
include/configs/hi3519v101_nand.h:210:#define CONFIG_HIGMAC_PHY1_INTERFACE_MODE 1
```

```
drivers/net/higmacv300/higmac.c:45:static char *phy_intf_str[interface_modebutt] = {
```

2. 上面修改的值对照的就是这个索引.

```
static char *phy_intf_str[interface_modebutt] = {  
    "mii",  
    "rmii",  
    "rgmii",  
};
```

(也可以在Uboot里面调过命令行的方式修改为rmii模式, 这个为了简单, 就修改了默认配置)

3. 对照文档修改rmii的时钟

3519大概在下面位置

```
*****
```

```
~$ grep "PHY_CLK_50M" * -rn
```

```
drivers/net/higmacv300/ctrl.h:24:#define PHY_CLK_50M 1
```

```
drivers/net/higmacv300/ctrl.h:28:#define PHY_CLK_50M 0
```

```
drivers/net/higmacv300/ctrl.c:212: v |= (PHY_CLK_50M << BIT_EXT_PHY_CLK_SELECT);
```

```
*****
```

```
void higmac_sys_init(void)
```

```
{  
    unsigned long p = 0;  
    volatile unsigned int v = 0;  
  
    p = (unsigned long)(CRG_REG_BASE);  
  
    /* phy clk select */  
    v = readl(p + CRG_GMAC);  
    v &= ~(1 << BIT_EXT_PHY_CLK_SELECT);  
    //v |= (PHY_CLK_25M << BIT_EXT_PHY_CLK_SELECT); /* 修改:把时钟从25修改为50M */  
    v |= (PHY_CLK_50M << BIT_EXT_PHY_CLK_SELECT);  
    writel(v, p + CRG_GMAC);  
  
    规格书上有描述为什么是50M时钟...
```

表2-39 RMII 接口时序参数说明

参数	符号	信号	最小值	最大值	单位
RMII 时钟周期	T	REF_CLK	20	20	ns
RMII 信号建立时间	Tsu (RX)	CRS_DV/RXD[1:0]	4	-	ns
RMII 信号保持时间	Thd (RX)	CRS_DV/RXD[1:0]	2	-	ns
RMII 输出信号延时	Tov (TX)	TXEN/TXD[1:0]	3	16	ns

3.PHY地址，一般都默认是1，参考硬件即可；

4.uboot 确定phy地址正确的方法.

hisilicon # mii dump 0 0

```
0. (3100)          -- PHY control register --
(8000:0000) 0.15  =  0  reset
(4000:0000) 0.14  =  0  loopback
(2040:2000) 0. 6,13 = b01  speed selection = 100 Mbps
(1000:1000) 0.12  =  1  A/N enable
(0800:0000) 0.11  =  0  power-down
(0400:0000) 0.10  =  0  isolate
(0200:0000) 0. 9  =  0  restart A/N
(0100:0100) 0. 8  =  1  duplex = full
(0080:0000) 0. 7  =  0  collision test enable
(003f:0000) 0. 5- 0 =  0  (reserved)
```

hisilicon # mii dump 0 1

```
0. (3100)          -- PHY control register --
(8000:0000) 0.15  =  0  reset
(4000:0000) 0.14  =  0  loopback
(2040:2000) 0. 6,13 = b01  speed selection = 100 Mbps
(1000:1000) 0.12  =  1  A/N enable
(0800:0000) 0.11  =  0  power-down
(0400:0000) 0.10  =  0  isolate
(0200:0000) 0. 9  =  0  restart A/N
(0100:0100) 0. 8  =  1  duplex = full
(0080:0000) 0. 7  =  0  collision test enable
(003f:0000) 0. 5- 0 =  0  (reserved)
```

2.2 内核配置

./arch/arm/boot/dts/hisi-hi3519v101-demb.dts

./arch/arm/boot/dts/hisi-hi3519v101-hmp-demb.dts

```
&higmac {
    compatible = "hisilicon,higmac-v3", "hisilicon,higmac";
    phy-handle = <&ethphy>;
    phy-mode = "rmii";
};
```

Hi3519V101 海思sdk的kernel 这边默认的模式是rgmii，我们板子要用rmii，因此我要修改成rmii模式。  
我的配置方法如下：

- 1.hisi-hi3519v101-hmp-demb.dts中phy-mode = "rgmii"改成phy-mode = "rmii";
  - 2.0x12040140复用成RMII\_CLK，即pinmux\_hi3519v101.sh中net\_rgmii\_pinmux函数
- himm 0x12040140 0x3;**

**3519和其它有些差异，IO口复用在这个excel文档里面。**

Hi3519V101\_PINOUT\_CN.xlsx
